

MobileIron Delivers Strong Security and Modern Management to Macs

Enterprises are increasingly expected to support Macs as corporate-approved devices. In order to be in compliance, it is imperative that all devices accessing sensitive corporate and customer data be fully secured and managed. MobileIron delivers a new model for authentication and identity to Macs and enables enterprises to unify Apple mobile and desktop operations using a common security and management platform. MobileIron's layered security can be extended to not only corporate-owned Macs, but to employee-owned devices as well. And, IT organizations can bring Macs under management across the organization with unparalleled speed and at scale thanks to seamless integration with Apple's Device Enrollment Program (DEP) and Volume Purchase Program (VPP).

Modern authentication raises the bar on security

Our support for encryption, remote configuration of Mac firewalls, VPN integrations, and certificate deployment protect your employee's data while delivering a friendly and unobtrusive setup experience. An admin can specify a mandatory password on the device and can force the device to encrypt using powerful FileVault 2 encryption. Once a device is enrolled, MobileIron continuously monitors the security state of the device. For instance, if a Mac has been unencrypted, the admin can enforce automated compliance actions as needed.

MobileIron also delivers a secure model for authentication and identity by providing unique capabilities that secure Macs and prevent data loss. As more users access a range of cloud services such as Salesforce, Office 365, Box and others from their Macs, IT needs to ensure that only trusted devices, trusted apps and trusted users have access to sensitive data residing in these cloud services. MobileIron helps organizations address this emerging data loss risk with a unique approach.

Intuitive admin interface for Mac configurations

Whether you wish to deploy Wi-Fi, VPN, email, or many other configurations over the air, MobileIron's simplified management console makes day-to-day Mac enablement a breeze. Configurations are installed as standard Apple .mobileconfig profiles while the admin console makes it intuitive for the IT administrators to create, edit and assign them.

The Power of DEP

For organizations that participate in Apple's DEP, registration is as simple as powering on a new Mac or a repurposed Mac that has been reset to factory defaults. Registration occurs as part of the Apple Setup Assistant, and admins can choose to have devices enroll automatically for later assignment or to prompt users for enterprise credentials. MobileIron allows administrators to provision administrator and user accounts on the device over the air. For more information on Apple's Device Enrollment Program and how it can help your organization, please visit <http://www.apple.com/business/dep/>

Enable your employees with apps

When a Mac enrolls with MobileIron, our enterprise app catalog is automatically distributed.

The app catalog allows end users to choose from a list of apps that an admin has assigned to the user or team. Integration with VPP means that apps can be pre-purchased by the IT department and, if desired, installed on the Mac. Enterprise customers can retain app licensing and reassign as needed. Admins can also decide which apps they will trust from Apple's public App Store. For instance, they may decide to disallow users from installing apps from untrusted sources.

To Learn More

Mac management is available today for all current MobileIron Cloud customers. For more information, or to sign up for a 30-day free trial of MobileIron Cloud, please visit us at mobileiron.com/cloud

Or ask your sales rep about MobileIron Core 9.5 which supports macOS security and management.
